

# STRUCTURED QUERY LANGUAGE(SQL)

By:-

Amit Yerpude

PGT (Computer Science)

Kendriya Vidyalaya , Khagaria

# **Basic Database concepts**

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

**Data :-** Raw facts and figures which are useful to an organization. We cannot take decisions on the basis of data.

**Information:-** Well processed data is called information. We can take decisions on the basis of information

**Field:** Set of characters that represents specific data element.

**Record:** Collection of fields is called a record. A record can have fields of different data types.

# Basic Database concepts

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

**Database:** Collection of logically related data along with its description is termed as database.

**Tuple:** A row in a relation is called a tuple.

**Attribute:** A column in a relation is called an attribute. It is also termed as field or data item.

**Degree:** Number of attributes in a relation is called degree of a relation.

**Cardinality:** Number of tuples in a relation is called cardinality of a relation.

# **Basic Database concepts**

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

**Primary Key:** Primary key is a key that can uniquely identifies the records/tuples in a relation. This key can never be duplicated and NULL.

**Foreign Key:** Foreign Key is a key that is defined as a primary key in some other relation. This key is used to enforce referential integrity in RDBMS.

**Candidate Key:** Set of all attributes which can serve as a primary key in a relation.

**Alternate Key:** All the candidate keys other than the primary keys of a relation are alternate keys for a relation.

# Basic Database concepts

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

**DBA:** Data Base Administrator is a person (manager) that is responsible for defining the data base schema, setting security features in database, ensuring proper functioning of the data bases etc.

# STRUCTURED QUERY LANGUAGE ( S Q L )

# Structured Query Language

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

**SQL** is a non procedural language that is used to create, manipulate and process the databases(relations).

## Characteristics of SQL

- ✓ It is very easy to learn and use.
- ✓ Large volume of databases can be handled quite easily.
- ✓ It is non procedural language. It means that we do not need to specify the procedures to accomplish a task but just to give a command to perform the activity.
- ✓ SQL can be linked to most of other high level languages that makes it first choice for the database programmers.

# Structured Query Language

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## Processing Capabilities of SQL

The following are the processing capabilities of SQL.

### 1.Data Definition Language (DDL)

DDL contains commands that are used to create the tables, databases, indexes, views, sequences and synonyms etc.

e.g: **Create table, create view, create index, alter table**

# Structured Query Language

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## Processing Capabilities of SQL

### 2. Data Manipulation Language (DML)

DML contains command that can be used to manipulate the data base objects and to query the databases for information retrieval.

e.g

**Select, Insert, Delete, Update.**

# Structured Query Language

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## Processing Capabilities of SQL

### 3. View Definition:

DDL contains set of command to create a view of a relation.

e.g : **create view**

### 4. Data Control Language:

This language is used for controlling the access to the data.  
The commonly used commands DCL are,

**GRANT, REVOKE**

# Structured Query Language

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## Processing Capabilities of SQL

### 5. Transaction Control Language (TCL)

TCL include commands to control the transactions in a data base system. The commonly used commands in TCL are

**COMMIT, ROLLBACK**

# Data types of SQL

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

Just like any other programming language, the facility of defining data of various types is available in SQL also. Following are the most common data types of SQL.

1. **NUMBER**
2. **CHAR**
3. **VARCHAR / VARCHAR2**
4. **DATE**
5. **LONG**
6. **RAW/LONG RAW**

# Data types of SQL

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## 1. NUMBER

Used to store a numeric value in a field/column. It may be decimal, integer or a real value. General syntax is:

**Number(n,d)**

Where **n** specifies the number of digits and

**d** specifies the number of digits to the right of the decimal point.

e.g marks number(3) declares marks to be of type number with maximum value 999.

pct number(5,2) declares pct to be of type number of 5 digits with two digits to the right of decimal point.

# Data types of SQL

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## 2. CHAR

Used to store character type data in a column. General syntax is

**Char (size)**

where size represents the maximum number of characters in a column. The CHAR type data can hold at most 255 characters.

e.g name char(25) declares a data item name of type character of upto 25 size long.

# Data types of SQL

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## 3. VARCHAR/VARCHAR2

This data type is used to store variable length alphanumeric data. General syntax is,

**`varchar(size) / varchar2(size)`**

where size represents the maximum number of characters in a column. The maximum allowed size in this data type is 2000 characters.

e.g **`address varchar(50);`**

address is of type varchar of upto 50 characters long.

# Data types of SQL

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## 4. DATE

Date data type is used to store dates in columns. SQL supports the various date formats other than the standard DD-MON-YY.

e.g **dob date;** declares dob to be of type date.

## 5. LONG

This data type is used to store variable length strings of up to 2 GB size.

e.g **description long;**

# Data types of SQL

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## 6. RAW/LONG RAW

To store binary data (images/pictures/animation/clips etc.) RAW or LONG RAW data type is used. A column LONG RAW type can hold upto 2 GB of binary data.

e.g **image raw(2000);**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## CREATE TABLE Command:

Create table command is used to create a table in SQL. It is a DDL type of command. The general syntax of creating a table is

```
create table <table> (  
<column 1> <data type> [not null] [unique] [<column  
constraint>],  
.....  
<column n> <data type> [not null] [unique] [<column  
constraint>],  
[<table constraint(s)>]  
);
```

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## CREATE TABLE Command:

For each column, a name and a data type must be specified and the column name must be unique within the table definition. Column definitions are separated by comma. Uppercase and lowercase letters makes no difference in column names, the only place where upper and lower case letters matter are strings comparisons. A not null Constraint means that the column cannot have null value, that is a value needs to be supplied for that column. The keyword unique specifies that no two tuples can have the same attribute value for this column.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Constraints:

Constraints are the conditions that can be enforced on the attributes of a relation. The constraints come in play when ever we try to insert, delete or update a record in a relation.

1. NOT NULL
2. UNIQUE
3. PRIMARY KEY
4. FOREIGN KEY
5. CHECK
6. DEFAULT

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Constraints:

**1. NOT NULL:** Ensures that we cannot leave a column as null. That is a value has to be supplied for that column.

e.g     name varchar(25) not null;

**2. UNIQUE:** Constraint means that the values under that column are always unique.

e.g     Roll\_no number(3) unique;

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Constraints:

**3. PRIMARY KEY:** Constraint means that a column can not have duplicate values and not even a null value.

e.g. Roll\_no number(3) primary key;

The main difference between unique and primary key constraint is that a column specified as unique may have null value but primary key constraint does not allow null values in the column.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Constraints:

**4. FOREIGN KEY:** Is used to enforce referential integrity and is declared as a primary key in some other table.

e.g     `cust_id varchar(5) references master(cust_id);`

it declares `cust_id` column as a foreign key that refers to `cust_id` field of table `master`. That means we cannot insert that value in `cust_id` field whose corresponding value is not present in `cust_id` field of `master` table.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Constraints:

**5. CHECK:** Constraint limits the values that can be inserted into a column of a table.

e.g      marks    number(3) check(marks>=0);

The above statement declares marks to be of type number and while inserting or updating the value in marks it is ensured that its value is always greater than or equal to zero.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Constraints:

**6. DEFAULT:** Constraint is used to specify a default value to a column of a table automatically. This default value will be used when user does not enter any value for that column.  
e.g balance number(5) default = 0;

```
CREATE TABLE student (  
Roll_no      number(3) primary key,  
Name         varchar(25) not null,  
Class        varchar(10),  
Marks        number(3) check(marks>0),  
City         varchar(25) );
```

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Operators in SQL:

The following are the commonly used operators in SQL

✓ <b>Arithmetic Operators</b>	<b>+, -, *, /</b>
✓ <b>Relational Operators</b>	<b>=, &lt;, &gt;, &lt;=, &gt;=, &lt;&gt;</b>
✓ <b>Logical Operators</b>	<b>OR, AND, NOT</b>

✓ **Arithmetic operators** are used to perform simple arithmetic operations.

✓ **Relational Operators** are used when two values are to be compared and

✓ **Logical operators** are used to connect search conditions in the WHERE Clause in SQL.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Data Modifications in SQL

After a table has been created using the create table command, tuples can be inserted into the table, or tuples can be deleted or modified.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Data Modifications in SQL

### INSERT Statement

The simplest way to insert a tuple into a table is to use the insert statement

**insert into <table> [(<column i, . . . , column j>)] values  
(<value i, . . . , value j>);**

**INSERT INTO student  
VALUES(101,'Rohan','XI',400,'Chennai');**

While inserting the record it should be checked that the values passed are of same data types as the one which is specified for that particular column.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Data Modifications in SQL

### INSERT Statement

For inserting a row interactively (from keyboard) & operator can be used.

e.g     INSERT INTO student  
VALUES(&Roll\_no', '&Name', '&Class', '&Marks', '&City');

In the above command the values for all the columns are read from keyboard and inserted into the table student.

***NOTE:- In SQL we can repeat or re-execute the last command typed at SQL prompt by typing “/” key and pressing enter.***

# SQL Commands

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## TABLE : STUDENT

Roll_no	Name	Class	Marks	City
101	Rohan	XI	400	Chennai
102	Aneeta	XII	390	Bengaluru
103	Pawan Kumar	IX	298	Mysore
104	Rohan	IX	376	Mangalore
105	Sanjay	VII	240	Mumbai
106	Anju	VIII	432	Delhi

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Queries:

To retrieve information from a database we can query the databases. SQL SELECT statement is used to select rows and columns from a database/relation

## SELECT Command

This command can perform **selection** as well as **projection**.

**Selection:** This capability of SQL can return you the tuples from a relation with all the attributes.

**Projection:** This is the capability of SQL to return only specific attributes in the relation.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## SELECT Command

✓ **SELECT \* FROM student;** command will display all the tuples in the relation student

✓ **SELECT \* FROM student WHERE Roll\_no <=102;**

The above command display only those records whose Roll\_no less than or equal to 102.

Select command can also display specific attributes from a relation.

✓ **SELECT name, class FROM student;**

The above command displays only name and class attributes from student table.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## SELECT Command

✓ **SELECT count(\*) AS “Total Number of Records”  
FROM student;**

Display the total number of records with title as “Total Number of Records” i.e an alias

We can also use arithmetic operators in select statement, like

✓ **SELECT Roll\_no, name, marks+20 FROM student;**

✓ **SELECT name, (marks/500)\*100 FROM student  
WHERE Roll\_no > 103;**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Eliminating Duplicate/Redundant data

**DISTINCT** keyword is used to restrict the duplicate rows from the results of a **SELECT** statement.

e.g. **SELECT DISTINCT name FROM student;**

The above command returns,

### Name

Rohan

Aneeta

Pawan Kumar

# SQL Commands

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## Conditions based on a range

SQL provides a **BETWEEN** operator that defines a range of values that the column value must fall for the condition to become true.

e.g. **SELECT Roll\_no, name FROM student WHERE Roll\_no BETWEEN 100 AND 103;**

The above command displays Roll\_no and name of those students whose Roll\_no lies in the range 100 to 103 (both 100 and 103 are included in the range).

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Conditions based on a list

To specify a list of values, IN operator is used. This operator select values that match any value in the given list.

e.g. **SELECT \* FROM student WHERE city IN ('Bengaluru','Delhi','Chennai');**

The above command displays all those records whose city is either **Bengaluru or Delhi or Chennai**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Conditions based on Pattern

SQL provides two wild card characters that are used while comparing the strings with LIKE operator.

- a. **percent ( % )**                      Matches any string
- b. **Underscore ( \_ )**                      Matches any one character

e.g     **SELECT Roll\_no, name, city FROM student  
WHERE Roll\_no LIKE “%3”;**

displays those records where last digit of Roll\_no is 3 and may have any number of characters in front.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Conditions based on Pattern

e.g **SELECT Roll\_no, name, city FROM student  
WHERE Roll\_no LIKE "1\_3";**

displays those records whose Roll\_no starts with 1 and second letter may be any letter but ends with digit 3.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## ORDER BY Clause

**ORDER BY** clause is used to display the result of a query in a specific order(sorted order).

The sorting can be done in ascending or in descending order. It should be kept in mind that the actual data in the database is not sorted but only the results of the query are displayed in sorted order.

e.g. **SELECT name, city FROM student ORDER BY name;**

The above query returns name and city columns of table student sorted by name in increasing/ascending order.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## ORDER BY Clause

e.g. **SELECT \* FROM student ORDER BY city DESC;**

It displays all the records of table student ordered by city in descending order.

**Note:-If order is not specifies that by default the sorting will be performed in ascending order.**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## GROUP BY Clause

The GROUP BY clause can be used in a SELECT statement to collect data across multiple records and group the results by one or more columns.

The syntax for the GROUP BY clause is:

```
SELECT column1, column2, ... column_n,  
aggregate_function (expression)  
FROM tables  
WHERE conditions  
GROUP BY column1, column2, ... column_n;
```

# SQL Commands

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## GROUP BY Clause

*aggregate\_function* can be a function such as SUM, COUNT, MAX, MIN, AVG etc.

e.g     **SELECT name, COUNT(\*) as "Number of  
employees"     FROM student WHERE marks>350  
  
GROUP BY city;**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## HAVING Clause

The **HAVING** clause is used in combination with the **GROUP BY** clause. It can be used in a **SELECT** statement to filter the records that a **GROUP BY** returns.

The syntax for the **HAVING** clause is:

```
SELECT column1, column2, ... column_n,  
aggregate_function (expression)  
FROM tables  
WHERE predicates  
GROUP BY column1, column2, ... column_n  
HAVING condition1 ... condition_n;
```

# SQL Commands

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## HAVING Clause

e.g     **SELECT SUM(marks) as "Total marks"**  
         **FROM student**  
         **GROUP BY department**  
         **HAVING SUM(sales) > 1000;**

**Note: select statement can contain only those attribute which are already present in the group by clause.**

# **SQL Commands**

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

## **Functions available in SQL**

SQL provide large collection of inbuilt functions also called library functions that can be used directly in SQL statements.

- 1. Mathematical functions**
- 2. String functions**
- 3. Date & Time functions**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 1. Mathematical functions

Some of the commonly used mathematical functions are sum(), avg(), count(), min(), max() etc.

e.g. **SELECT sum(marks) FROM student;**

displays the sum of all the marks in the table student.

e.g. **SELECT min(Roll\_no), max(marks) FROM student;**

displays smallest Roll\_no and highest marks in the table student.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

These functions are used to deal with the string type values like

ASCII, LOWEWR, UPPER, LEN, LEFT, RIGHT, TRIM, LTRIM, RTRIM etc.

**ASCII** : Returns the ASCII code value of a character (leftmost character of string).

Syntax: **ASCII(character)**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

<b>SELECT ASCII('a')</b>	returns	97
--------------------------	---------	----

<b>SELECT ASCII('A')</b>	returns	65
--------------------------	---------	----

<b>SELECT ASCII('1')</b>	returns	49
--------------------------	---------	----

<b>SELECT ASCII('ABC')</b>	returns	65
----------------------------	---------	----

For Upper character 'A' to 'Z' ASCII value 65 to 90

For Lower character 'a' to 'z' ASCII value 97 to 122

For digit '0' to '9' ASCII value 48 to 57

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

For Upper character 'A' to 'Z' ASCII value 65 to 90

For Lower character 'a' to 'z' ASCII value 97 to 122

For digit '0' to '9' ASCII value 48 to 57

**NOTE:** If no table name is specified then SQL uses Dual table which is a dummy table used for performing operations

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

**LOWER** : Convert character strings data into lowercase.

Syntax: **LOWER(string)**

**SELECT LOWER('STRING FUNCTION')**

returns      **string function**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Functions available in SQL

### 2. String functions

**UPPER** : Convert character strings data into Uppercase.

Syntax: **UPPER(string)**

**SELECT UPPER('string function')**

returns      **STRING FUNCTION**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Functions available in SQL

### 2. String functions

**LEN** : Returns the length of the character string.

Syntax: **LEN(string)**

**SELECT LEN('STRING FUNCTION')**

returns      **15**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Functions available in SQL

### 2. String functions

**REPLACE** : Replaces all occurrences of the second string(string2) in the first string(string1) with a third string(string3).

Syntax: **REPLACE('string1','string2','string3')**

**SELECT REPLACE('STRING FUNCTION','STRING','SQL')**

returns **SQL Function**

**Returns NULL if any one of the arguments is NULL.**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

**LEFT** : Returns left part of a string with the specified number of characters counting from left. LEFT function is used to retrieve portions of the string.

Syntax: **LEFT(string,integer)**

**SELECT LEFT('STRING FUNCTION', 6)**

**returns      STRING**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

**RIGHT** : Returns right part of a string with the specified number of characters counting from right. RIGHT function is used to retrieve portions of the string.

Syntax: **RIGHT(string,integer)**

**SELECT RIGHT('STRING FUNCTION', 8)**

returns      **FUNCTION**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

**LTRIM** : Returns a string after removing leading blanks on Left side.(Remove left side space or blanks)

Syntax: **LTRIM(string)**

**SELECT LTRIM(' STRING FUNCTION')**

returns **STRING FUNCTION**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

**RTRIM** : Returns a string after removing leading blanks on Right side.(Remove right side space or blanks)

Syntax: **RTRIM( string )**

**SELECT RTRIM('STRING FUNCTION ')**

returns **STRING FUNCTION**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Functions available in SQL

### 2. String functions

**REVERSE** : Returns reverse of a input string.

Syntax: **REVERSE(string)**

**SELECT REVERSE('STRING FUNCTION')**

returns      **NOITCNUF GNIRTS**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Functions available in SQL

### 2. String functions

**REPLICATE** : Repeats a input string for a specified number of times.

Syntax: **REPLICATE (string, integer)**

**SELECT REPLICATE('FUNCTION', 3)**

returns      **FUNCTIONFUNCTIONFUNCTION**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Functions available in SQL

### 2. String functions

**SPACE** : Returns a string of repeated spaces. The SPACE function is an equivalent of using REPLICATE function to repeat spaces.

Syntax: **SPACE ( integer)**

(If integer is negative, a null string is returned.)

**SELECT ('STRING') + SPACE(1) + ('FUNCTION')**

returns      **STRING FUNCTION**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

**SUBSTRING** : Returns part of a given string.

**SUBSTRING** function retrieves a portion of the given string starting at the specified character(startindex) to the number of characters specified(length).

Syntax: **SUBSTRING (string,startindex,length)**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## Functions available in SQL

### 2. String functions

**SUBSTRING** : Returns part of a given string.

**SELECT SUBSTRING('STRING FUNCTION', 1, 6)**

returns **STRING**

**SELECT SUBSTRING('STRING FUNCTION', 8, 8)**

returns **FUNCTION**

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## DELETE Command

To delete the record from a table SQL provides a delete statement. General syntax is:-

**DELETE FROM <table\_name> [WHERE <condition>];**

e.g. DELETE FROM student WHERE city = 'Chennai';

This command deletes all those records whose city is Chennai.

**NOTE:** It should be kept in mind that while comparing with the string type values lowercase and uppercase letters are treated as different. That is 'Jammu' and 'jammu' is different while comparing.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

## UPDATE Command

To update the data stored in the data base, UOPDATE command is used.

e. g.        **UPDATE student SET marks = marks + 100;**

Increase marks of all the students by 100.

e. g.        **UPDATE student SET City = 'Hydrabad'**  
              **WHERE city = 'Bangaluru';**

changes the city of those students to Hydrabad whose city is Bangaluru.

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## UPDATE Command

We can also update multiple columns with update command, like

e. g.     **UPDATE student set marks = marks + 20, city  
             = 'Mangalore'  
             WHERE city NOT IN ('Delhi','Mysore');**

# SQL Commands

## CREATE VIEW Command

In SQL we can create a view of the already existing table that contains specific attributes of the table.

e. g. the table student that we created contains following fields:

**Student (Roll\_no, Name, Marks, Class, City)**

Suppose we need to create a view **v\_student** that contains Roll\_no,name and class of student table, then Create View command can be used:

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria 8/5/2020

## CREATE VIEW Command

```
CREATE VIEW v_student AS SELECT Roll_no, Name,  
Class FROM student;
```

The above command create a virtual table (view) named **v\_student** that has three attributes as mentioned and all the rows under those attributes as in student table.

We can also create a view from an existing table based on some specific conditions, like

```
CREATE VIEW v_student AS SELECT Roll_no, Name,  
Class FROM student WHERE City <>'Delhi';
```

# SQL Commands

## CREATE VIEW Command

The main difference between a Table and view is that:

A **Table** is a repository of data. The table resides physically in the database.

A **View** is not a part of the database's physical representation. It is created on a table or another view. It is precompiled, so that data retrieval behaves faster, and also provides a secure accessibility mechanism.

# SQL Commands

## ALTER TABLE Command

In SQL if we ever need to change the structure of the database then ALTER TABLE command is used. By using this command we can add a column in the existing table, delete a column from a table or modify columns in a table.

### **Adding a column**

The syntax to add a column is:-

```
ALTER TABLE table_name  
ADD column_name datatype;
```

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## ALTER TABLE Command

e.g **ALTER TABLE student ADD(Address varchar(30));**

The above command add a column Address to the table student.

If we give command

**SELECT \* FROM student;**

The following data gets displayed on screen:

# SQL Commands

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## TABLE : STUDENT

Roll_no	Name	Class	Marks	City	Address
101	Rohan	XI	400	Chennai	
102	Aneeta	XII	390	Bengaluru	
103	Pawan Kumar	IX	298	Mysore	
104	Rohan	IX	376	Mangalore	
105	Sanjay	VII	240	Mumbai	
106	Anju	VIII	432	Delhi	

**Note that we have just added a column and there will be no data under this attribute. UPDATE command can be used to supply values / data to this column.**

8/5/2020

## ALTER TABLE Command

### Removing a column

```
ALTER TABLE table_name  
DROP COLUMN column_name;
```

e.g        **ALTER TABLE Student  
DROP COLUMN Address;**

The column Address will be removed from the table student

# SQL Commands

## DROP TABLE Command

Sometimes you may need to drop a table which is not in use. DROP TABLE command is used to Delete / drop a table permanently. It should be kept in mind that we can not drop a table if it contains records. That is first all the rows of the table have to be deleted and only then the table can be dropped.

The general syntax of this command is:-

**DROP TABLE <table\_name>;**

**e.g            DROP TABLE student;**

This command will remove the table student

# Relational Algebra

Presented By:- Amit 8/5/2020  
Yerpude, PGT CS, KV  
Khagaria

It is the collections of rules and operations on relations(tables). The various operations are selection, projection, Cartesian product, union, set difference and intersection, and joining of relations.

## Define the terms:

### i. Database Abstraction

Ans: Database system provides the users only that much information that is required by them, and hides certain details like, how the data is stored and maintained in database at hardware level. This concept/process is Database abstraction.

### ii. Data inconsistency

Ans: When two or more entries about the same data do not agree i.e. when one of them stores the updated information and the other does not, it results in data inconsistency in the database.

# Relational Algebra

## Define the terms:

### iii. Conceptual level of database implementation/abstraction

Ans: It describes what data are actually stored in the database. It also describes the relationships existing among data. At this level the database is described logically in terms of simple data-structures.

### iv. Primary Key

Ans : It is a key/attribute or a set of attributes that can uniquely identify tuples within the relation.

# Relational Algebra

Presented By:- Amit  
Yerpude, PGT CS, KV  
Khagaria

8/5/2020

## Define the terms:

### v. Candidate Key

Ans : All attributes combinations inside a relation that can serve as primary key are candidate key as they are candidates for being as a primary key or a part of it.

### vi. Relational Algebra

Ans : It is the collections of rules and operations on relations(tables). The various operations are selection, projection, Cartesian product, union, set difference and intersection, and joining of relations.

# Relational Algebra

Yerpude, PGT CS, KV  
Khagaria 8/5/2020

**Define the terms:**

**vii. Domain**

Ans : it is the pool or collection of data from which the actual values appearing in a given column are drawn.

Q: What are the types of commands are available in SQL?

Ans: SQL have five types of commands

1. DDL (Data Definition Language) Commands
2. DML (Data Manipulation Language) Commands
3. TCL (Transaction Control Language) Commands
4. Session Control Commands
5. System Control Commands

Q: What is the purpose of DDL Commands in SQL?

Ans: DDL Commands are used for

1. Creating a database,
2. Creating tables in a database,
3. Creating Views based on Tables
4. Modifying structure of a table
5. Deleting table / View / Database

Q: Write name of some DDL commands available given in your textbook.

Ans: Following DDL commands are available in SQL and in given in our textbook:

1. CREATE DATABASE
2. CREATE TABLE
3. CREATE VIEW
4. ALTER TABLE
5. DROP TABLE

Q: How we can create a database in SQL?  
Write command syntax for creating a database with the name **School**.

Ans: The SQL CREATE DATABASE command / statement is used to create a new database.

Syntax: The basic syntax of this CREATE DATABASE statement is as follows

CREATE DATABASE DatabaseName;

Always the database name should be unique within the RDBMS (Relational Data Base Management System).

Example:

```
mysql> CREATE DATABASE School;
```

Q: How we can see that the School database has been created in SQL?

Ans: The SQL SHOW DATABASES command / statement is used to view the list of databases exists in SQL.

Example:

```
mysql> SHOW DATABASES;
```

Database
information_schema
AMROOD
TUTORIALSPOINT
mysql
orig
test
School

List of database containing School

```
7 rows in set (0.00 sec)
```

**Q: How we can select a database for operations from the list of existing database in SQL?**

Ans: When you have multiple databases in your SQL Schema, then before starting your operation, you would need to select a database where all the operations would be performed.

The SQL **USE** statement is used to select any existing database in the SQL.

### Syntax

The basic syntax of the USE statement is as shown below –

**USE DatabaseName;**

Always the database name should be unique within the RDBMS.

### Example

```
mysql> USE School;
```

*Database changed* is displayed as a result of this command.

**Q: How we can create a Table in current database in use?**

Ans: The SQL **CREATE TABLE** statement is used to create a new table in the current database.

Creating a basic table involves naming the table and defining its columns and each column's data type. The name must be unique.

The basic syntax of the CREATE TABLE statement is as follows –

```
CREATE TABLE TableName
( column1 datatype [<(size)> <filed constraint>],
  column2 datatype [<(size)> <filed constraint>],
  column3datatype, [<(size)> <filed constraint>]
  .....
  columnN datatype [<(size)> <filed constraint>],
  <Table Constraint>
);
```

**Q: Explain the use of CREATE TABLE command with a suitable example.**

**Ans:**

We will try to create a table employee with the following details in School.

```
mysql> CREATE TABLE EMPLOYEE
```

```
(  
    EMPID      INT           PRIMARY KEY,  
    NAME       VARCHAR (20)  NOT NULL,  
    DEPT       VARCHAR (20)  NOT NULL,  
    DESIG      VARCHAR (20)  NOT NULL,  
    BASIC      DECIMAL (8, 2),  
);
```

Q: How we can come to know that that a table with the name EMPLOYEE has been created or not.?

Ans:

SHOW TABLES statement is used to list the tables present in selected database or current database.

```
mysql> SHOW TABLES;
```

```
+-----+-----+  
| Tables in School      |  
+-----+-----+  
| Employee              |  
+-----+-----+  
1 row in set <0.0 sec>
```

Q: How we can see the structure of a table created by CREATE TABLE Command?

Ans:

DESCRIBE TABLENAME or DESC TABLENAME statement is used to show the structure of the TableName used with the DESCRIBE command.

```
mysql> DESC EMPLOYEE;
```

Field	Type	Null	Key	Default	Extra
EMPID	int(11)	NO	PRI		
NAME	varchar(20)	NO			
DEPT	varchar(20)	NO			
DESIG	varchar(20)	NO			
BASIC	decimal(8,2)	YES		NULL	

5 row in set <0.0 sec>

Q: How you can add a new field in the table employee at the end of the table structure.

Ans:

ALTER TABLE command /statement is used to add a new field to the table that already exists.

Syntax

```
ALTER TABLE <TABLENAME>  
    ADD column [<(size)>, [constraints>];
```

```
mysql> ALTER TABLE EMPLOYEE  
    ADD DA Decimal(5,2);
```

This command will add column DA at the end of the table structure. see the structure

```
mysql> DESC EMPLOYEE;
```

**Q: How we can add a column at the top of the table structure?**

Ans: **FIRST** Clause is used with ALTER TABLE command / statement to add a new field to the top of the table structure.

**Syntax**

```
ALTER TABLE <TABLENAME>  
ADD column [<(size)>, [constraints>]  
FIRST;
```

```
mysql> ALTER TABLE EMPLOYEE  
      ADD ROLL TINYINT NOT NULL FIRST;
```

```
mysql> DESC EMPLOYEE;
```

**Q: How we can add a column before an existing column of the table structure?**

Ans: **BEFORE** filename Clause is used with ALTER TABLE command / statement to add a new filed to the top of the table structure.

**Syntax**

```
ALTER TABLE <TABLENAME>  
ADD column [<(size)>, [constraints>]  
BEFORE Filename;
```

```
mysql> ALTER TABLE EMPLOYEE  
ADD SEX CHAR(1) NOT NULL  
BEFORE DESIG;
```

```
mysql> DESC EMPLOYEE;
```

**Q: How we can change name / rename an existing file?**

Ans: **CHANGE** Clause is used with ALTER TABLE command / statement to rename a new field to the top of the table structure.

**Syntax**

ALTER TABLE <TABLENAME>

**CHANGE** OldColName NewColName

[<(size)>, [constraints>];

```
mysql> ALTER TABLE EMPLOYEE  
        CHANGE SEX GENDER CHAR(12) NOT  
        NULL;
```

```
mysql> DESC EMPLOYEE;
```

**Any Questions Please**

*Thank You  
Very Much*
